

Web-based Account Management (WAM) System

WAM is a secure virtual collaborative web-based environment for centralized data sharing and communication.

WAM is useful for multi-agency partnerships that span diverse geographical regions to promote cohesion and project development. Couple WAM with Qwik-SurGen to gain the most secure data collection and management system.

WAM has four unique functions that provide a powerful and flexible working environment

Accounts – Individual accounts are set up for each member. Each member can be assigned to one or more divisions within the organization

Library – All materials stored in the Library are accessible to all members. Sections can be set up to allow for categorizing materials for easy access and storage

Reports - Restricted access to a Reports section can be given to selected divisions and their members.

Requests - Request forms can be stylized to allow members to request services from the systems administrator or other members. These may include data requests or Library upload requests

WAM is easy to use and incorporate into a larger organizational culture

Email notification – automatically notify members when new information has been included

Threaded discussion – each report or library document has an associated threaded discussion associated with it, allowing members to keep a running dialog about that document

Permissions – there are 10 levels of permissions that allow tremendous flexibility in member access and systems administrator control

Survey access / data download – Survey links can be included on the WAM homepage, data collection is controlled by the systems administrator, and data download capability can be assigned to selected members by the systems administrator
